

Claims Agent Deployment Summary

Generated on August 11, 2026 for the dev environment in ap-southeast-2.

Current Status

The live stack is working end to end with DeepSeek V4 Pro as the document intelligence model. The deployed UI, backend, OCR callback path, and graph workflow were exercised successfully.

Frontend URL	https://d2mq7u0i5f6mq8.cloudfront.net/
Health URL	https://d2mq7u0i5f6mq8.cloudfront.net/health
Live provider	DeepSeek V4 Pro via https://api.deepseek.com
Live ECS task definition	claims-agent-dev-api:9
Validated claim	CLM-DS-556714
Validated document result	OCR completed, document type detected as invoice
Validated workflow result	Workflow 2 reached waiting_for_human at step human_review

Agent Invocation Notes

Subagents were not invoked in this task. All investigation, deployment changes, browser testing, and validation were handled by the main Codex agent only.

Terraform Reproducibility Notes

The checked-in Terraform now includes the OpenAI-compatible secret wiring and the DeepSeek configuration values needed for reproducible deployments.

Remaining drift still exists in AWS versus Terraform state. A fresh terraform plan shows Terraform would create an ECS service named claims-agent-dev-api, while the live service currently in use is claims-agent-dev-api-live. The state also still reflects an older API task definition revision, which means the repo is logically correct for provider settings but not yet fully reconciled for service identity.

Files Updated In Repo

infra/environments/dev/ecs.tf, infra/environments/dev/locals.tf, infra/environments/dev/variables.tf, infra/environments/dev/terraform.tfvars, and infra/environments/dev/terraform.tfvars.example.

Recommended Next Cleanup

Either import or rename the live ECS service so Terraform manages the same service object that is currently serving production traffic in dev. After that, rerun terraform plan and apply so the DeepSeek deployment is reproducible without manual ECS task registration or service updates.
